

(a) GR1 flow (4 steps), 40 states
sample spectrum per state; eff. rank median 3.1 of 232 dims

(b) $\pi_{0.5}$ flow (10 steps), 60 states
sample spectrum per state; eff. rank median 4.6 of 350 dims

(c) variance captured by the leading PCs
(median, IQR over states)

(d) is the dominant sampling axis the timing axis?
 $\pi_{0.5}$: yes (gripper-transition timing); GR1: no (median = random baseline)
