

No free lunch: every family loses somewhere
 ~100%-success demonstrators · all executed behaviour · panel B adds 0.05mm/step execution noise · all policies history-conditioned

A Transient excursions: each one returns to the baseline

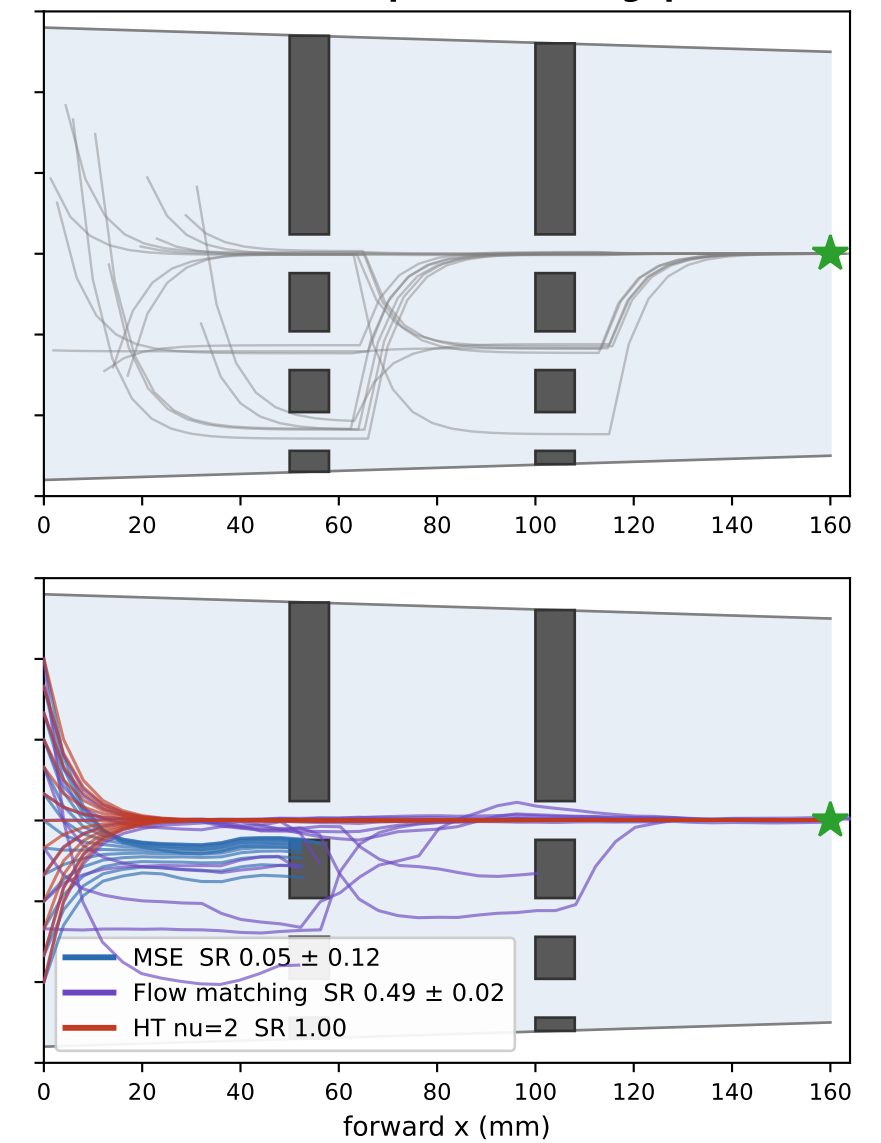

Both point estimates hold the baseline — flow arrives still deflected

B Block detour: 70/30 split, staggered commitment

Flow wins — HT commits and clears (0% collisions), the mean drives in (100%)

C Slot slalom: two plates, three gaps each

HT wins — the mean falls between lanes, the sampler switches lanes
