

Large path-level separation: only HT commits far enough to clear the decision gate

TRAINED MODELS — 8 seeds; 3,000 successful routes/seed; route modes −1 (70%), +1 (20%), +5 (10%); shared decision states balanced 40×

Mechanism: route mean = 0 → L2 enters the obstacle; MIP moves only partway toward the dominant route; HT's robust location selects the complete 70% route. This is path multimodality, not post-hoc label noise.
