

A constructive 2D no-free-lunch task: when action modes are nuisance, MIP's denoising projection can hurt

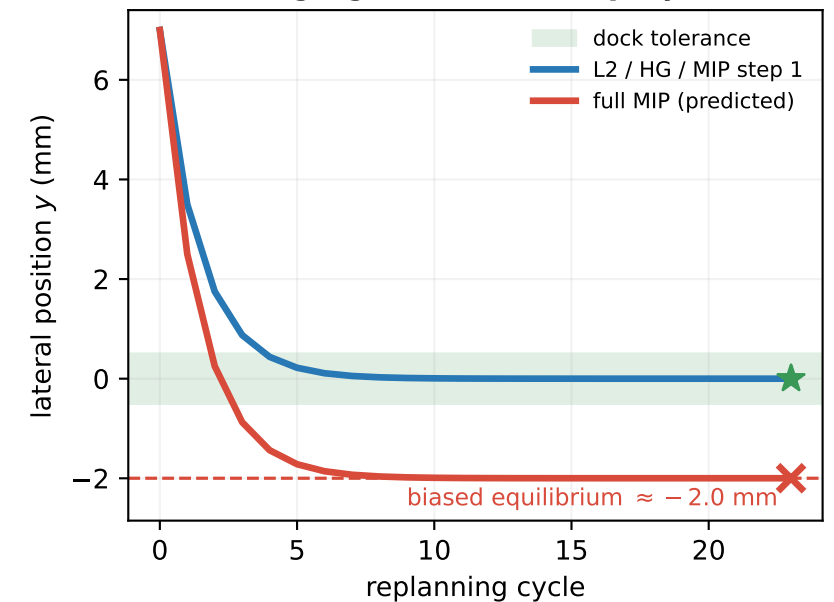

DESIGN + POPULATION PREDICTION (not a trained-model result): asymmetric zero-mean joystick jitter; convex averaging is the correct control law

C The inductive-bias collision

E Predicted closed loop Averaging docks; mode projection misses

Falsifiers / controls: symmetric mixture -> tie | matched Gaussian jitter -> tie | reveal nuisance/style -> MIP recovers | step-1-only -> centers | sweep mixture separation / anchor noise -> analytic phase curve
